

Framework

The 3-tier classification

Tier 1 — Mandatory (all 3 required, no trade without them)

1. EMA stack + structure — $EMA9 > EMA21 > EMA50$, all sloping in trade direction. Price respects EMAs via pullbacks, not breakdowns through them. This is the trend.

2. Price on correct side of VWAP — CALL: price above VWAP. PUT: price below VWAP. This is the intraday institutional bias. Trading against VWAP means trading against the session's dominant flow.

3. Pullback + trigger candle — Price pulls back into EMA9 or EMA21 on low volume, then forms a strong reclaim/rejection candle. No pullback = chasing. No trigger candle = guessing.

Tier 2 — Confirmation (pick 1–2, adds conviction, not required)

Volume increase — Trigger candle volume visibly higher than the pullback candles. Not a fixed $2\times$ threshold — just clearly elevated vs surrounding bars. Adds conviction, not required.

MACD above zero / turning in direction — MACD line above zero for CALL, below zero for PUT. Or histogram turning positive/negative on signal candle. Confirms momentum direction.

5-min Supertrend — Green for CALL, red for PUT. Useful confidence boost but redundant with EMA stack. Use as a tiebreaker, never as a gate.

Tier 3 — Context only (read for awareness, never for filtering)

Bollinger Bands — Tells you if price is extended (near upper/lower band) or building energy (squeeze). Useful for sizing and target setting, never for entry filtering.

15-min Supertrend — Adds lag, causes late entries, redundant if 5-min EMA trend is clean. Check it for awareness of bigger picture only. Never wait for it to confirm.

My one refinement to your framework

Volume on the trigger candle — still matters, differently. You're right that the fixed $2\times$ rule is too restrictive and conflicts with pullbacks (pullback candles are naturally low volume). The refinement: volume on the reclaim/rejection candle must be visibly higher than the last 2–3 pullback candles. This isn't a threshold — it's a relative comparison. If the trigger candle has the same thin volume as the pullback candles, the reclaim lacks conviction and you skip or wait. This replaces the $2\times$ rule entirely if any.

Scoring system

Live scorer:

Select trade direction

CALL trade

PUT trade

☐

Mandatory EMA9 > EMA21 > EMA50, all sloping up

Price above EMA21, pulling back (not breaking down)

+2

☐

Mandatory Price above VWAP

VWAP is below current price, acting as support

+2

☐

Mandatory Pullback to EMA9/21 + bullish reclaim candle

Low-vol pullback, then green candle reclaims EMA9 with higher volume vs pullback bars

+1

☐

Confirm Volume elevated on reclaim candle vs pullback bars

Not a fixed ratio — just visibly higher than surrounding pullback candles

+1

☐

Confirm MACD above zero OR histogram turning positive

Either condition qualifies — do not require both

+1

☐

Confirm 5-min Supertrend green

Confidence booster — fresh flip carries more weight

+1

CALL Playbook:

CALL = buy call options. Profit when price rises. Every condition below is written specifically for the long/bullish direction.

TIER 1 — ALL 3 MANDATORY (NO EXCEPTIONS)

1 Mandatory EMA stack bullish + structure intact

EMA9 > EMA21 > EMA50, all three sloping upward. Price must be pulling back into EMA9 or EMA21 — not breaking below EMA21 on a 5-min close. If price closes a 5-min candle below EMA21, the setup is void. Wait for recovery or skip.

EMA9 > EMA21 > EMA50 All sloping up Price above EMA21

2 Mandatory Price above VWAP

VWAP must be below current price at the time of entry. The ideal CALL setup has price pulling back toward VWAP — but still above it — and bouncing. If price is below VWAP, there is no CALL trade regardless of EMA structure.

Price > VWAP VWAP acting as support

3 Mandatory Pullback + bullish reclaim candle

Price must pull back into EMA9 or EMA21 on visibly lower volume (confirming weak sellers). Then form a strong bullish candle — green body, preferably with a lower wick — that reclaims EMA9. Volume on this reclaim candle must be visibly higher than the pullback candles. Enter at the close of this candle or the open of the next.

Low-vol pullback to EMA9/21 Strong green reclaim candle Volume higher than pullback bars

Tier 2 — Confirmation (add 1–2 for conviction)

4 Confirmation Volume on trigger candle elevated vs pullback

Not a fixed 2× rule. Look at the last 2–3 pullback candles — the trigger/reclaim candle should stand out as clearly larger. If volumes look similar, the reclaim lacks conviction — reduce size or wait one more candle.

5 Confirmation MACD above zero or histogram turning positive

MACD line above zero = momentum already bullish. Histogram bar turning from negative to positive on the signal candle = fresh momentum shift. Either qualifies. Do NOT require both — that's over-filtering.

6 Confirmation 5-min Supertrend green

Green ST = confidence booster. If ST just flipped green on the signal candle, that's extra weight. If ST is already green for several candles, it simply confirms existing trend — still useful, just less fresh.

Tier 3 — Context (read, never filter)

— Context **Bollinger Bands**

If price is near upper BB: be aware of mean reversion risk. Consider smaller first lot. BB squeeze resolving upward: bigger potential move brewing. Use for sizing and target estimation — never to gate entry.

— Context **15-min Supertrend**

Check once before the session. If 15-min ST is also green, you have higher-timeframe tailwind — purely a confidence note. Never delay entry waiting for it to align.

CALL entry sequence — step by step

A Confirm trend at session open

Check EMA stack (bullish fan?), VWAP position (price above?), and 5-min ST color. If all three point up, you are in CALL-hunting mode for the day.

B Watch for pullback into EMA9 or EMA21

Price retreats toward EMA9 or EMA21. Volume on pullback candles must be visibly lower — this tells you sellers are weak, not that the trend is reversing. Do not enter during the pullback.

C Wait for the trigger candle

A green candle forms at EMA9/21 with a lower wick and clearly higher volume than pullback bars. This is the reclaim. This is your entry signal. Enter at the close of this candle or at the open of the next candle.

D Set SL before anything else

SL = low of the trigger candle - $0.5 \times \text{ATR}(14)$. If SL invalidates R:R below 2.0, skip this setup. Do not widen SL to force a trade.

E Scale exit — never single target

TGT1 at $1.5 \times$ SL distance: exit 40%, move SL to entry (breakeven). TGT2 at $2.5 \times$ SL distance: exit 40%. Remaining 20%: trail with $1 \times \text{ATR}$ stop — let it run.

CALL INVALIDATION — EXIT IMMEDIATELY

- 5-min candle closes below EMA21 → trend structure broken, exit all
- MACD histogram shrinks for 2 consecutive bars → momentum dying, start exiting
- Price falls back below VWAP on a candle close → intraday bias has flipped, exit
- Price reaches upper Bollinger Band → exit 50%, trail remaining with $1 \times \text{ATR}$
- Red candle volume exceeds surrounding green candle volume → reduce to 50% position

PUT Playbook

PUT = buy put options. Profit when price falls. Every condition below is written specifically for the short/bearish direction. Do not confuse with CALL rules.

Tier 1 — All 3 mandatory (no exceptions)

1 **Mandatory** **EMA stack bearish + structure intact**

EMA9 < EMA21 < EMA50, all three sloping downward. Price must be bouncing up toward EMA9 or EMA21 — not breaking above EMA21 on a 5-min close. If price closes a 5-min candle above EMA21, the PUT setup is void. Wait or skip.

EMA9 < EMA21 < EMA50 All sloping down Price below EMA21

2 **Mandatory** **Price below VWAP**

VWAP must be above current price at the time of entry. Ideal PUT setup has price bouncing up toward VWAP — but still below it — and getting rejected. If price is above VWAP, there is no PUT trade regardless of EMA structure.

Price < VWAP VWAP acting as resistance

3 **Mandatory** **Bounce + bearish rejection candle**

Price bounces up toward EMA9 or EMA21 on visibly lower volume (confirming weak buyers). Then forms a strong bearish candle — red body, preferably with an upper wick — that rejects EMA9. Volume on this rejection candle must be visibly higher than the bounce candles. Enter at the close of this candle or the open of the next.

Low-vol bounce to EMA9/21 Strong red rejection candle Volume higher than bounce bars

Tier 2 — Confirmation (add 1–2 for conviction)

4 **Confirmation** **Volume on rejection candle elevated vs bounce**

The rejection candle should stand out clearly vs the last 2–3 bounce candles. If volumes look the same, the rejection lacks conviction — wait one more candle or reduce size by half.

5 **Confirmation** **MACD below zero or histogram turning negative**

MACD line below zero = momentum already bearish. Histogram bar turning from positive to negative on the signal candle = fresh momentum shift. Either qualifies. Do not require both.

6 **Confirmation** **5-min Supertrend red**

Red ST = confidence booster. Fresh ST flip to red on the signal candle carries more weight than an ST that's been red for 20 candles. Use as tiebreaker, never as gate.

Tier 3 — Context (read, never filter)

— **Context** **Bollinger Bands**

If price is near lower BB: mean reversion risk — be cautious about entering a full PUT position. BB squeeze resolving downward: bigger move likely. If bands are expanding and price is walking lower BB: strong trend continuation — hold existing positions longer.

— **Context** **15-min Supertrend**

Check once before session. If 15-min ST is also red, you have higher-timeframe alignment — a confidence note only. Never delay a clean 5-min PUT setup waiting for 15-min ST to turn.

PUT entry sequence — step by step

A Confirm trend at session open

Check EMA stack (bearish fan?), VWAP position (price below?), and 5-min ST color. If all three point down, you are in PUT-hunting mode for the day.

B Watch for bounce into EMA9 or EMA21

Price bounces up toward EMA9 or EMA21. Volume on bounce candles must be visibly lower — weak buyers, not trend reversal. Do not enter during the bounce.

C Wait for the rejection candle

A red candle forms at EMA9/21 with an upper wick and clearly higher volume than bounce bars. This is the rejection. This is your entry signal. Enter at the close of this candle or at the open of the next.

D Set SL before anything else

SL = high of the trigger candle + $0.5 \times \text{ATR}(14)$. If SL makes R:R below 2.0, skip. Do not move SL wider to justify entry.

E Scale exit — never single target

TGT1 at $1.5 \times$ SL distance below entry: exit 40%, move SL to entry (breakeven). TGT2 at $2.5 \times$ SL distance: exit 40%. Remaining 20%: trail with $1 \times \text{ATR}$ stop.

PUT invalidation — exit immediately

- 5-min candle closes above EMA21 → bearish structure broken, exit all
- MACD histogram shrinks (less negative) for 2 consecutive bars → downside momentum fading, exit
- Price closes above VWAP on a candle close → intraday bias has flipped bullish, exit
- Price reaches lower Bollinger Band → exit 50%, trail remaining with $1 \times \text{ATR}$
- Green candle volume exceeds surrounding red candle volume → buyers stepping in, reduce to 50%

Indicator guide:

Quick reference — what each indicator tells you and how to read it for CALL vs PUT.

Indicator	CALL signal	PUT signal	Tier
EMA 9	Above EMA21, sloping up. Pullback to EMA9 = entry zone.	Below EMA21, sloping down. Bounce to EMA9 = entry zone.	Mandatory
EMA 21	Above EMA50, sloping up. No 5-min close below it.	Below EMA50, sloping down. No 5-min close above it.	Mandatory
EMA 50	Lowest of the 3. Acts as strong support on deep pullbacks.	Highest of the 3. Acts as strong resistance on deep bounces.	Mandatory
VWAP	Price above VWAP. VWAP acts as dynamic support. Pullback to VWAP that bounces = best CALL entry of the day.	Price below VWAP. VWAP acts as dynamic resistance. Bounce to VWAP that rejects = best PUT entry of the day.	Mandatory
Volume	Pullback candles: low vol. Reclaim candle: visibly higher than pullback bars. Not a fixed threshold.	Bounce candles: low vol. Rejection candle: visibly higher than bounce bars. Not a fixed threshold.	Confirm
MACD	Above zero OR histogram turning positive. Confirms bullish momentum. Do not require both.	Below zero OR histogram turning negative. Confirms bearish momentum. Do not require both.	Confirm
Supertrend 5m	Green. Use as confidence boost. Fresh flip to green on signal candle = stronger signal.	Red. Use as confidence boost. Fresh flip to red on signal candle = stronger signal.	Confirm
Bollinger Bands	Near upper band = caution, smaller size. Squeeze breaking up = bigger move. Use for sizing.	Near lower band = caution, smaller size. Squeeze breaking down = bigger move. Use for sizing.	Context
Supertrend 15m	Green = higher-TF tailwind. Check once at open. Never delay entry for it.	Red = higher-TF tailwind. Check once at open. Never delay entry for it.	Context

Risk calculator

Enter your trade parameters. SL is set from trigger candle high/low + $0.5 \times \text{ATR}$. R:R must be ≥ 2.0 — if not, skip the trade.

Parameters

CALL

PUT

Entry price (₹)
₹3,957

Trigger candle range / ATR (pts)
25 pts

Capital at risk (₹)
₹10,000

Rules:

Non-negotiable rules

1. All 3 mandatory conditions must be met — no exceptions Missing even one mandatory = no trade. The score system exists to enforce this, not to negotiate around it.
2. SL is placed before entry — always Know exactly where you are wrong before you enter. SL = below **swing low** / **EMA21** + buffer (0.3–0.5 ATR). Allow setup only giving 1.7+ R:R, anything below skip it.
3. Never enter during the pullback or bounce Entering during a pullback (CALL) or bounce (PUT) is guessing, not trading. Wait for the trigger/rejection candle. Patience here is where the edge lives.
4. R:R minimum 2.0 — below this, sit out Sitting in cash is a valid position. A mediocre setup with 1.5 R:R taken 10 times destroys what 3 strong setups at 2.5 R:R build.
5. Scale out — 40% / 40% / 20%, never all at once Book 40% at TGT1, move SL to **just below EMA9 or last higher low**. Book 40% at TGT2. Trail 20% with 1×ATR stop. This structure guarantees partial profit even on partial wins.
6. After TGT1, move SL to just below **EMA9 or recent higher low (pullback low)** — non-negotiable The remaining 60% now risks zero capital. You are playing with profit. This removes the emotional pressure to exit early and lets winners run.
7. No trades 9:15–9:30 (first 15 minutes) Opening volatility is not your edge. Let institutions fight the gap-fill battle. Enter after the trend establishes — cleaner EMA structure, cleaner VWAP relationship.
8. No revenge trade after SL hit Wait minimum 15 minutes. The candle that hit your SL is not the re-entry signal. A new setup must form cleanly from scratch.

9. Max 2–3 trades per day Quality over quantity. Two score-5+ setups per day will compound better than six score-3 setups. More trades means more decay on options, more slippage, more emotional error. Only suggestion though.

10. VWAP violation must be confirmed — not automatic exit

CALL: If price **closes below VWAP and shows follow-through weakness**, exit.

PUT: If price **closes above VWAP and shows follow-through strength**, exit.

A single VWAP cross or wick is **not enough** — price often sweeps VWAP and reclaims.

Exit only when VWAP is **lost with acceptance (close + continuation)**.

VWAP loss with confirmation means the intraday institutional bias is likely shifting, and your original thesis is no longer valid.

11. Do not take entries if price is extended far from EMA9 or near upper Bollinger Band

Best setups ranked by quality

1. VWAP pullback/bounce + EMA9/21 confluence + rejection candle

When VWAP aligns closely with EMA9 or EMA21 in a clear uptrend, it forms a high-probability confluence zone. A strong rejection from this level with increasing volume and clean structure is an A+ setup.

Avoid if VWAP is flat/choppy or price is repeatedly crossing it — confluence only matters when the market is respecting levels.

2. BB squeeze breakout in EMA trend direction Rare but highest R:R. When bands tighten for 5+ candles and then break in the EMA direction, the move is usually large and sustained. Take full size. Take the trade only if:

- Breakout candle has **strong body + volume**
- Price is **not immediately extended far from EMA9**

Prefer entering on a **slight pullback after breakout** rather than chasing the first expansion candle.

3. Clean EMA9/21 pullback in strong trend Bread-and-butter setup. Trend strong, price pulls to EMA9, low-volume drift, then a clean reclaim/rejection candle with volume. The most frequent valid setup in any trending day.

In a strong trend, price pulls back to EMA9 or EMA21 with **controlled, low-volume drift**, then forms a clean bullish rejection/reclaim candle with rising volume.

Avoid if:

- Pullback is **sharp/high-volume (distribution)**
- Price breaks below EMA21 with momentum
- Structure becomes messy (no clear higher low)
